

# Airview for Developer

Created by YueYang Chen, last modified on Sep 20, 2023

## Intro

Product intro: [https://confluence.nike.com/display/\[redacted\]Airview](https://confluence.nike.com/display/[redacted]Airview)

Bassoon README: [https://github.com/\[redacted\]](https://github.com/[redacted])

Developer intro video (Chinese): [https://nike.box.com/\[redacted\]](https://nike.box.com/[redacted])

## Dashboard-to-pipeline mapping

[redacted]	[redacted]	[redacted]	[redacted]	[redacted]
[redacted]	[redacted]	[redacted]	[redacted]	[redacted]
	[redacted]	[redacted]	[redacted]	[redacted]
	[redacted]	[redacted]	[redacted]	[redacted]
[redacted]	[redacted]	[redacted]	[redacted]	[redacted]
	[redacted]	[redacted]	[redacted]	[redacted]
[redacted]	[redacted]	[redacted]	[redacted]	[redacted]
[redacted]	[redacted]	[redacted]	[redacted]	[redacted]
[redacted]	[redacted]	[redacted]	[redacted]	[redacted]
	[redacted]	[redacted]	[redacted]	[redacted]
	[redacted]	[redacted]	[redacted]	[redacted]
	[redacted]	[redacted]	[redacted]	[redacted]

## Implementation Procedures

### Path 1: if not timely constrained

1. Summarize what the task is doing with a few words
  - a. If in doubt, have a live session with stakeholders to address vague requirements
2. Align with leads to finalize the SF table name
3. Use bassoon to develop the pipeline to generate the SF table
4. Build up the Tableau dashboard
5. Iterate between steps 3 and 4

### Path 2: if timely constrained

1. Summarize what the task is doing with a few words
  - a. If in doubt, have a live session with stakeholders to address vague requirements
2. Prioritize items
3. Align with leads to finalize the SF table name
4. Generate dummy data to the SF table
5. Build up the dashboard
6. Align with stakeholder for the look
7. Use bassoon to develop the pipeline to generate the SF table
8. Build up the Tableau dashboard
9. Iterate between steps 7 and 8

## Principles

### 1. Uniform naming convention

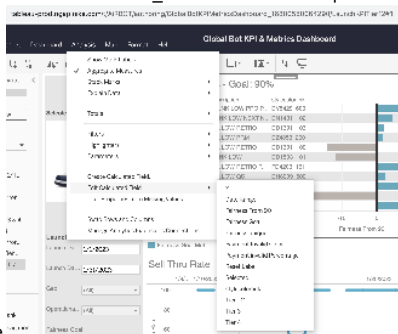

- a. Tableau fields & SF columns
  - i. Tableau field names must be consistent with SF column names.

AIRVIEW_BIZRULE_DAILY			
Name			
AIRVIEW_BIZRULE_DAILY			
Fields			
Type	Field Name	Physical Table	Remote Field Name
Abc	Change Type	Custom SQL Query	CHANGE_TYPE
Abc	[redacted]	[redacted]	[redacted]
Abc	Process Dt	Custom SQL Query	PROCESS_DT
Abc	Rule1	Custom SQL Query	RULE1
Abc	Rule2	Custom SQL Query	RULE2
Abc	Rule3	Custom SQL Query	RULE3
Abc	Rule4	Custom SQL Query	RULE4
Abc	Rule5	Custom SQL Query	RULE5

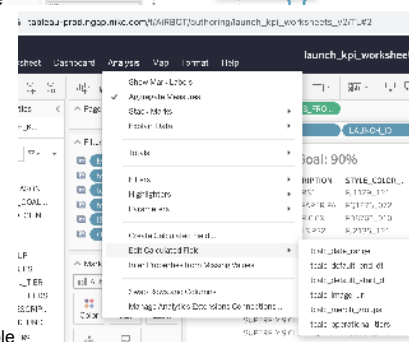

1. Bad example

AIRVIEW_LAUNCH_KPL_BY...			
Name			
AIRVIEW_LAUNCH_KPL_BY_LAUNCH			
Fields			
Type	Field Name	Physical Table	Remote Field Name
Absc	LAUNCH_ID	AIRVIEW_LAUNCH_KPL_BY_LAUNCH	LAUNCH_ID
Absc	MERCH_GROUP	AIRVIEW_LAUNCH_KPL_BY_LAUNCH	MERCH_GROUP
Absc	OPERATIONAL_TIER	AIRVIEW_LAUNCH_KPL_BY_LAUNCH	OPERATIONAL_TIER
Absc	STYLE_COLOR_UNDISCORED	AIRVIEW_LAUNCH_KPL_BY_LAUNCH	STYLE_COLOR_UNDISCORED
Absc	PRODUCT_DESCRIPTION	AIRVIEW_LAUNCH_KPL_BY_LAUNCH	PRODUCT_DESCRIPTION
⊞	LAUNCH_DT	AIRVIEW_LAUNCH_KPL_BY_LAUNCH	LAUNCH_DT
⊞	FAIRNESS	AIRVIEW_LAUNCH_KPL_BY_LAUNCH	FAIRNESS
⊞	FAIRNESS_FROM_90	AIRVIEW_LAUNCH_KPL_BY_LAUNCH	FAIRNESS_FROM_90

- 2. Good example
- 3. How to do that: <https://kb.tableau.com/articles/HowTo/how-to-revert-field-names-and-capitalization-changes>
- ii. SF column names should use snake\_case as the first option.
- iii. If Stakeholder asks to use "Human Readable" names on dashboard:
  - 1. Option 1 (preferred): push back
  - 2. Option 2: change SF column name
- b. Tableau calculated fields & parameters
  - i. Calculated fields should start with "calc " unless otherwise required.

### 1. Bad example

- ii. Tableau parameters should start with "param\_" unless otherwise required.
- c. Tableau dashboards, views, and worksheets
  - i. Tableau dashboard names
    - 1. Surface-level dashboard: put it under the "Airview" project and name it whatever stakeholders like
    - 2. Concrete-level dashboard: put it under the "developer only: concrete worksheets" project and use snake\_case
  - ii. Tableau views & worksheets
    - 1. Surface-level dashboard:
      - a. Entry view (first view): should be a story and named "story"
      - b. Story point views: should be dashboards named "db1", "db2", etc. Each should use a Webpage url that links to a worksheet of a concrete-level dashboard.
    - 2. Concrete-level dashboard:
      - a. First view: should be a dashboard named "db"
      - b. Other views: should be worksheets named by their positions in the dashboard, like "BL" (bottom left), "T3" (the 3rd item at the top row), etc.
- iii. Bad examples

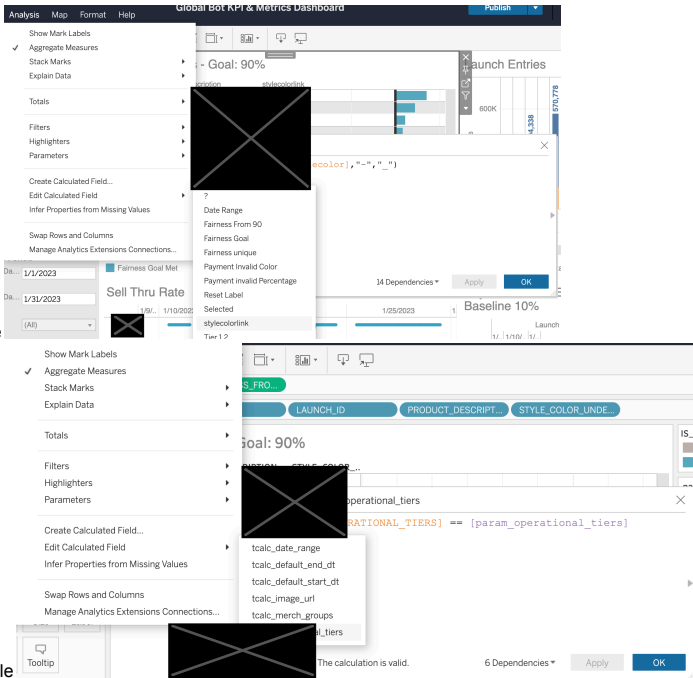

☐ Data Source	☐ dashboard	Geo Map	Top New Bots By Geo	Historical U
☐ Data Source	Launch Entries - T1/T2/EU,JP,US		Sell Thru Rate	Payment In

iv. Good example

Data Source	<b>story</b>	db1	db2	db3			
Data Source	<b>db</b>	TL	TR	BL	BR	BR_tooltip	

2. **Avoid Tableau Desktop as much as you can**
  - a. Ask me (YY) if you don't know how to achieve some functionality using Tableau Server online
3. **Avoid changing the SF table name that Tableau reads from**
  - a. Follow the "Implementation Procedures" section
4. **Deliberate the use of Tableau calculated fields**
  - a. Minimize the amount (use bassoon as primary tool to generate the fields)
    - i. Bad & good example: see "Tableau calculated fields & parameters" section
  - b. Minimize the calculation (use bassoon to do any data processing)

i. Bad example

ii. Good example

5. Do not use multiple tables in one worksheet
- a. If this thought ever comes up in your mind, you might need to do one or more of the following
    - i. Split the worksheet into two or more
    - ii. Combine your tables into one (with redundancy/denormalization)
    - iii. Reorganize the dashboard so that every story point uses only one underlying SF table
    - iv. Align with stakeholder for the reorganization
